

(9) Abstract

The present invention teaches a portable vaporizing device which, through the application of heat, successfully volatilizes one or more
5 constituents of various vaporizable substances, such as medicines and plant materials, for the purpose of inhaling these volatilized constituents. The invention may be successfully operated using the flame from a standard butane cigarette lighter or the like as the sole heat source. An additional embodiment of the device provides a substitute for a standard
10 slider-bowl allowing for the conversion of a standard waterpipe into a vaporizing device. A second additional embodiment allows for vaporization of cigarettes or portions thereof.
